Lea County

Eddy County Plains - Central Lea County - Southern Lea County

1945MST 0 15K 0 **Dust Storm** 

2020MST

A large and intense haboob swept south across the plains of Eddy and Lea Counties in southeast New Mexico during the early evening of the 1st. The haboob was associated with outflow from distant thunderstorms. It was accompanied by damaging winds in Eddy County (74 MPH measured Gust at Artesia) and severely reduced visibilities in both Lea and Eddy Counties. This photo was taken ten mile s west of Artesia (northern Eddy County) on Highway 82. The view is to the north-northwest at 19:40 MST. Photo courtesy Darby Posev, Sun Country, Volunteer Fire Department.

Thunderstorm activity well to the northeast of the Eddy and Lea County plains induced a strong mesohigh and associated outflow winds which evolved into a classic haboob wind and dust storm. The haboob swept south and southeast across most of those counties, and resulted in minor damage. Radar and surface observations indicate the outflow originated as a complex of weak and disorganized storms moved across the area northeast of Roswell, some 50 miles away from northern Eddy County. The Artesia AWOS measured a wind gust of 74 MPH. Real-time reports, along with subsequent photographs provided by the county emergency manager, indicated a large wall of dust associated with the leading edge of the damaging winds. Power poles were blown down as the winds swept across the west side of Carlsbad, at least 60 to 70 miles south of the parent thunderstorms. The haboob significantly reduced local visibilities across both Eddy and Lea Counties, with severe wind gusts limited to Eddy County. As the near surface cold pool spread south, mid level echoes were observed on radar developing just north of the boundary. This very shallow and weak convection (generally 20 to 25 dBZ at 15,000-17,000 feet AGL with no reflectivity echoes above 25,000 ft, and no lightning) possibly contributed to the longevity and intensity of the haboob through evaporation and sublimation of light precipitation aloft.

Dust Storm

A visually spectacular and widely photographed, hoboob affected the West Texas Permian Basin on the evening of June 3, 2003. This was the second such feature to impact the region within fourty-eight hours. The Permian Basin haboob originated as thunderstorm outflow surged southwest from a pair of supcrcell thunderstorms which moved out of the Texas South Plains, and evolved into a large convective complex over the northeast Permian Basin. Although wind speeds associated with the haboob were non-severe, visibilities were reduced to near zero.

#### **TEXAS** West

This landspout tornado developed seven miles north of Alpine, Texas during the afternoon of June 5, 2003. The tornado persisted ten minutes as it drifted very slowly to the southeast in the rural country side of the Texas Big Bend. Photo court esy John Ryan-Alpine, Texas.

Several local authorities reported a tornado which developed north of the city of Alpine, and moved very slowly toward the southeast over the next ten minutes. Radar indicated a severe thunderstorm in the area, but no indication of supercellular characteristics. This evidence, combined with photographs taken by Alpine authorities, indicate the tornado was likely a landspout type tornado. No damage was reported.

1 E Penwell to Pleasant Farms	05	2307CST 2335CST	(	0	0	105K	0	Thunderstorm Wind (MG53)

A trained weather spotter measured a 61 MPH severe thunderstorm wind gust with a home weather station near Penwell. These winds were responsible for overturning a tractor trailer on Interstate 20 at mile marker 102. The storm then propagated southeast toward the P leasant Farms vicinity. Several weakly constructed homes were heavily damaged in Pleasant Farms. Winds associated with the storm were likely higher than indicated across the southeast portions of the county, where most of the damage was concentrated. Due to the light construction of the damaged structures, the sole measured wind gust is referenced here instead of a damage based estimate.
